Jacobs U.K. Limited

This document has been prepared by a division, subsidiary or affiliate of Jacobs U.K. Limited ("Jacobs") in its professional capacity as consultants in accordance with the terms and conditions of Jacobs' contract with the commissioning party (the "Client"). Regard should be had to those terms and conditions when considering and/or placing any reliance on this document. No part of this document may be copied or reproduced by any means without prior written permission from Jacobs. If you have received this document in error, please destroy all copies in your possession or control and notify Jacobs.

Any advice, opinions, or recommendations within this document (a) should be read and relied upon only in the context of the document as a whole; (b) do not, in any way, purport to include any manner of legal advice or opinion; (c) are based upon the information made available to Jacobs at the date of this document and on current UK standards, codes, technology and construction practices as at the date of this document. It should be noted and it is expressly stated that no independent verification of any of the documents or information supplied to Jacobs has been made. No liability is accepted by Jacobs for any use of this document, other than for the purposes for which it was originally prepared and provided. Following final delivery of this document to the Client, Jacobs will have no further obligations or duty to advise the Client on any matters, including development affecting the information or advice provided in this document.

This document has been prepared for the exclusive use of the Client and unless otherwise agreed in writing by Jacobs, no other party may use, make use of or rely on the contents of this document. Should the Client wish to release this document to a third party, Jacobs may, at its discretion, agree to such release provided that (a) Jacobs' written agreement is obtained prior to such release; and (b) by release of the document to the third party, that third party does not acquire any rights, contractual or otherwise, whatsoever against Jacobs and Jacobs, accordingly, assume no duties, liabilities or obligations to that third party; and (c) Jacobs accepts no responsibility for any loss or damage incurred by the Client or for any conflict of Jacobs' interests arising out of the Client's release of this document to the third party.

1.1 Background

Traffic monitoring is being undertaken before, during and after construction of the Forth Replacement Crossing (FRC) Project in order to monitor the impacts of changing route provision and traffic management on traffic volumes and patterns within the Firth of Forth area. It is also intended that this will inform the Monitoring and Evaluation Report, which will be issued post construction.

Traffic management for the scheme was first installed on the M90 on the 23 September 2011. This report presents an analysis of the key traffic information, in the immediate vicinity of the crossing and the affected road network, for the period August 2011 to September 2012. It therefore allows a comparison of data for the first year of monitoring. The report also contains the details of journey time surveys undertaken between September 2011 and September 2012, on the key routes. Volumetric traffic data is recorded via Automatic Traffic Counters (ATCs). In order to establish 'baseline' traffic levels it was necessary to consider data that was available at existing ATC locations and consider the potential for new ATCs. The new ATCs were installed at various locations within the defined FRC monitoring area in July 2011.

Journey time surveys have been, and will continue to be undertaken on selected routes, subject to a periodic review of the analysis of the survey results. Surveys are undertaken on 11 identified local routes in the vicinity of the FRC each month and on two longer, strategic routes on an annual basis. Surveys are undertaken in each direction in both AM and PM peaks.

This forms the first Traffic Monitoring Annual Report. Future traffic monitoring reports will seek to identify any key changes in traffic levels and journey times throughout the monitoring period, and significant traffic related trends as new data becomes available.

1.2 ATC Data Reporting

In order to report consistent and accurate data, consultation with Transport Scotland's current traffic data provider has been undertaken. In order to allow the current traffic data validation process to be carried out, a period of up to two months is required to validate the data. It should be noted that the process of validation used cannot guarantee that all errors in the data are removed.

Data provided for analysis and production of the annual reports will therefore have a lag time of approximately two months. The data included in this report was obtained throughout the year, and most recently in November 2012, allowing a suitable validation period for analysis of flows captured in all months between August 2011 and September 2012. It should be noted that the data supplied is in a variety of different formats; therefore a degree of pre-analysis and data sorting is required.

1.3 Report Structure

The outline report structure is as follows:

- Section 2 details the methodology for collecting and reporting traffic flow data and analysis of currently available traffic flow data;
- Section 3 details the structure of the report for each individual counter throughout the monitoring period;
- Sections 4 to 7 contain the analysis of each individual counter for August 2011 to September 2012; and
- Section 8 details the methodology for collecting and reporting journey time data and presents the findings of the journey time surveys undertaken in the first year of monitoring, from September 2011 to September 2012.

2.1 Introduction

A series of ATCs have been used to monitor traffic levels on both local and strategic routes associated with the existing Forth crossings and surrounding areas. These monitoring stations include existing permanent counter sites and a number of newly installed counters to provide comprehensive coverage of the surrounding road network. These traffic counters will be in place throughout the construction period of the scheme to provide a robust basis for traffic monitoring. The counter locations are presented in Appendix A.

The locations of these counters are considered to be appropriate to suitably monitor both traffic impacts on local routes within communities adjacent to the scheme, and on wider trunk and motorway routes catering for more strategic traffic movements. The strategic traffic movements considered relevant to this monitoring exercise are as follows:

- Traffic movements across the Forth between the M9 (Stirling) and south of the Forth Road Bridge (FRB) via the FRB, Kincardine and Clackmannanshire Bridges;
- Traffic movements to the west of the proposed FRC on the A904 (west of Queensferry), the M9, A89 and M8 (west of Junction 2);
- Traffic movements to the west of Edinburgh on the A90 (west of Barnton Junction), A8, M8, A71, and A70 at Currie; and
- Traffic movements to the east and west of the M90 / A90 corridor in Fife, between the A92 at Halbeath Junction south to Ferrytoll Junction.

Data collected from the ATC installations has been used to present the following average traffic information for each month, based on 7-day traffic flows:

- AM peak (07:00 to 10:00), Inter Peak (10:00 to 16:00) and PM peak (16:00 to 19:00) flows;
- 24 hr flow by vehicle class;
- Average hourly flows; and
- Monthly variation.

Analysis of the survey data has been undertaken to monitor changes in traffic flows and composition at each counter location.

2.2 Traffic Flow Data Suitability

In order to check the suitability of the traffic survey data collected at each counter location, survey data was (and will be) assessed to establish:

- The number of days over which data was collected (the survey period); and
- The period of time within this survey period where the counter was operational.

Although a suitable period of time has passed to allow a degree of validation to be undertaken, this does not guarantee that all errors in the data have been removed. To enable a robust analysis of the data, some counter locations have not been

included in the analysis. Where the number of survey days within the established survey month is less than ten, it was considered that the use of monthly average values from this data could not be considered to present a suitably robust representation of typical values within the survey month.

The majority of counters contain a suitably large sample to represent monthly averages. This varies on month to month, and where a month is not considered to contain suitably robust data, "No Data" has been inserted into the table.

Consideration was also given to identifying the extent to which counters were not working properly during the defined survey months. This was established by identifying hourly total flows that were either zero or deviated significantly from expected traffic levels. Where identified, this data has been removed to prevent atypical flows skewing the results.

2.3 Contents of the Traffic Flow Analysis

To provide a consistent baseline for evaluation, August 2011 traffic flow data from each counter (existing and new) has been used to establish typical, pre-construction levels.

The monthly average traffic flows, AM and PM peak average traffic flows, monthly average Heavy Goods Vehicle (HGV) flows, AM and PM peak HGV flows and monthly average speeds for each month between August 2011 and September 2012 are presented in section 4 (Motorways), 5 (A-Roads), 6 (B-Roads) and 7 (Other Roads) for comparison.

In the tables contained within sections 4, 5, 6 and 7, the following are abbreviated as below:

- Northbound – NB;
- Southbound – SB;
- Eastbound – EB; and
- Westbound – WB.

3 Motorway Automatic Traffic Counters

3.1 Traffic Counter JTC00068 – M9 200m South of Keir Roundabout

Summary of statistics between August 2011 and September 2012:

- There was limited traffic flow data available for May to September 2012, therefore the data was not considered to be sufficiently representative for analysis.
- Traffic levels peak in August 2011, the typical peak months are May and July, but there is no data available for these months.
- Traffic levels are at their lowest in December 2011 and January 2012, this is typical seasonal variation.
- The AM and PM peak traffic flows follow a similar pattern to the AADT flows.
- The northbound and southbound flows are fairly similar in volume and follow a similar pattern of monthly variation.
- HGV flows follow a similar seasonal pattern.

3.2 Traffic Counter JTC00439 – M9 South of Junction 2 (Philpstoun)

Summary of statistics between August 2011 and September 2012:

- Limited traffic flow data was available for September 2012, therefore the data was not considered to be sufficiently representative for analysis.
- The data follows a typical seasonal variation pattern, with higher flows during the months of August 2011 and May 2012 and lower flows during the months of December 2011 and January 2012.
- At this particular location, the AADT flows and the PM peak flows are lower in August 2012, when compared to August 2011.
- All flow groups have a low flow for July 2012, this is not in keeping with seasonal variation, however, may be due to local factors.
- HGV flows follow a similar seasonal pattern.

3.3 Traffic Counter JTC00478 – A823 (M) M90 Junction 2 Southbound On-Ramp

Summary of statistics between August 2011 and September 2012:

- Limited traffic flow data was available for March 2012 and from May 2012 to September 2012, therefore the data was not considered to be sufficiently representative for analysis.
- The data across all three flow groups decreases from August 2011 to April 2012, this is not in keeping with typical seasonal variation.
- HGV flows follow a similar pattern.

3.6 Traffic Counter JTC00590 – A8000 / M9 Spur Southbound

Summary of statistics between August 2011 and September 2012:

- Traffic flow groups are indicative of typical seasonal variation; with lower flows in December 2011 and January 2012 and higher flows over the summer months.
- The flow groups were higher in August and September 2011 when compared to August and September 2012.

3.7 Traffic Counter JTC05478 – A823 (M) M90 Junction 2 Northbound On-Ramp

Summary of statistics between August 2011 and September 2012:

- Limited traffic flow data was available for May 2012 to September 2012, therefore the data was not considered to be sufficiently representative for analysis.
- Traffic flow groups are indicative of typical seasonal variation; with lower flows in December 2011 and January 2012. However, the flows were unusually low in October 2011.

3.8 Traffic Counter JTC05479 – A823 (M) M90 Junction 2 Northbound Off-Ramp

Summary of statistics between August 2011 and September 2012:

- The flow groups were higher in August and September 2011 when compared to August and September 2012.
- In between this time, flows drop substantially in October 2011; flows increase again in November, with a slight drop for December 2011 and January 2012. Traffic flows for the summer months are uncharacteristically low, increasing in August and September 2012.

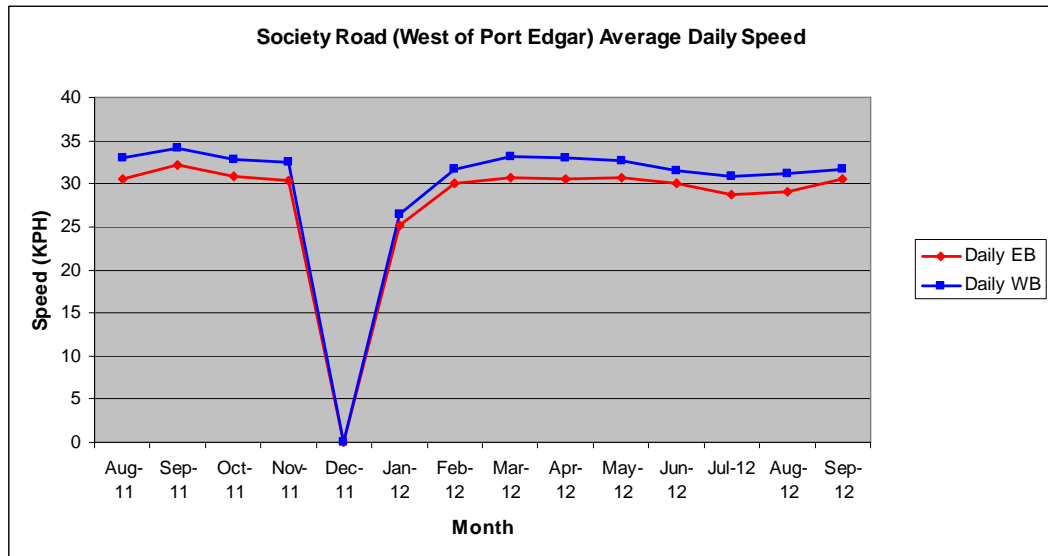

Figure 6-176 Average Monthly Traffic Speeds (KPH) on the Society Road (South Queensferry)

7 Journey Times

7.1 Introduction

Journey time surveys have been undertaken along 13 routes in the vicinity of the Forth Road Bridge (FRB) using GPS technology to establish typical journey times, and monitor any potential impacts, arising from for example changing traffic levels and patterns, on travel times for road users.

The routes identified broadly cover the same geographic area as the traffic counters and are intended to provide coverage of both local and strategic traffic routes. The strategic routes are shown in Figure 7-1 and local routes are shown in Figure 7-2.

The strategic journey time routes are:

1. M9 Junction 6 to M90 Halbeath Junction via Kincardine Bridge;
2. M9 Junction 6 to M90 Halbeath Junction via FRC / FRB

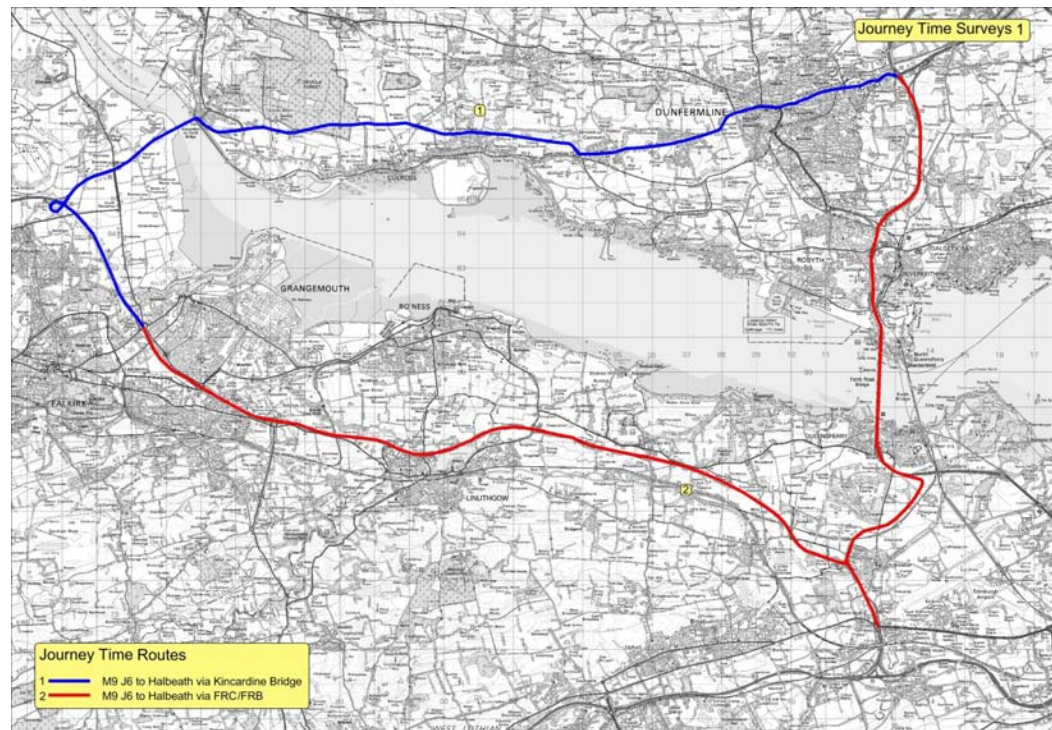

Figure 7-1 Strategic Journey Time Routes

Each strategic route was surveyed at least once per week over the period of one month in each year. Due to a delayed start in monitoring, it was only possible to survey each route once in September 2011 during the morning and evening peak periods.

The local journey time routes are as follows:

3. A90 between Echline Junction and Maybury Junction;
4. M9 Newbridge Junction to Echline Junction via the M9 Spur;
5. M9 Newbridge Junction to the A720 Hermiston Gate via the M8;
6. A8 between Gogar Junction and Newbridge Junction;
7. A90 Echline Junction to the M90 Halbeath Junction;
8. A985 between the A90 Admiralty Junction and Cairneyhill Roundabout;
9. A994 / A907 between Cairneyhill Roundabout and the M90 Halbeath Junction;
10. A823 (M) between the A907 and the M90 Masterton Junction;
11. A921 between the B9157 and the A90 Admiralty Junction;
12. B981 between the A92 and the A90 Admiralty Junction; and
13. A904 between Old Philpstoun and Echline Junction.

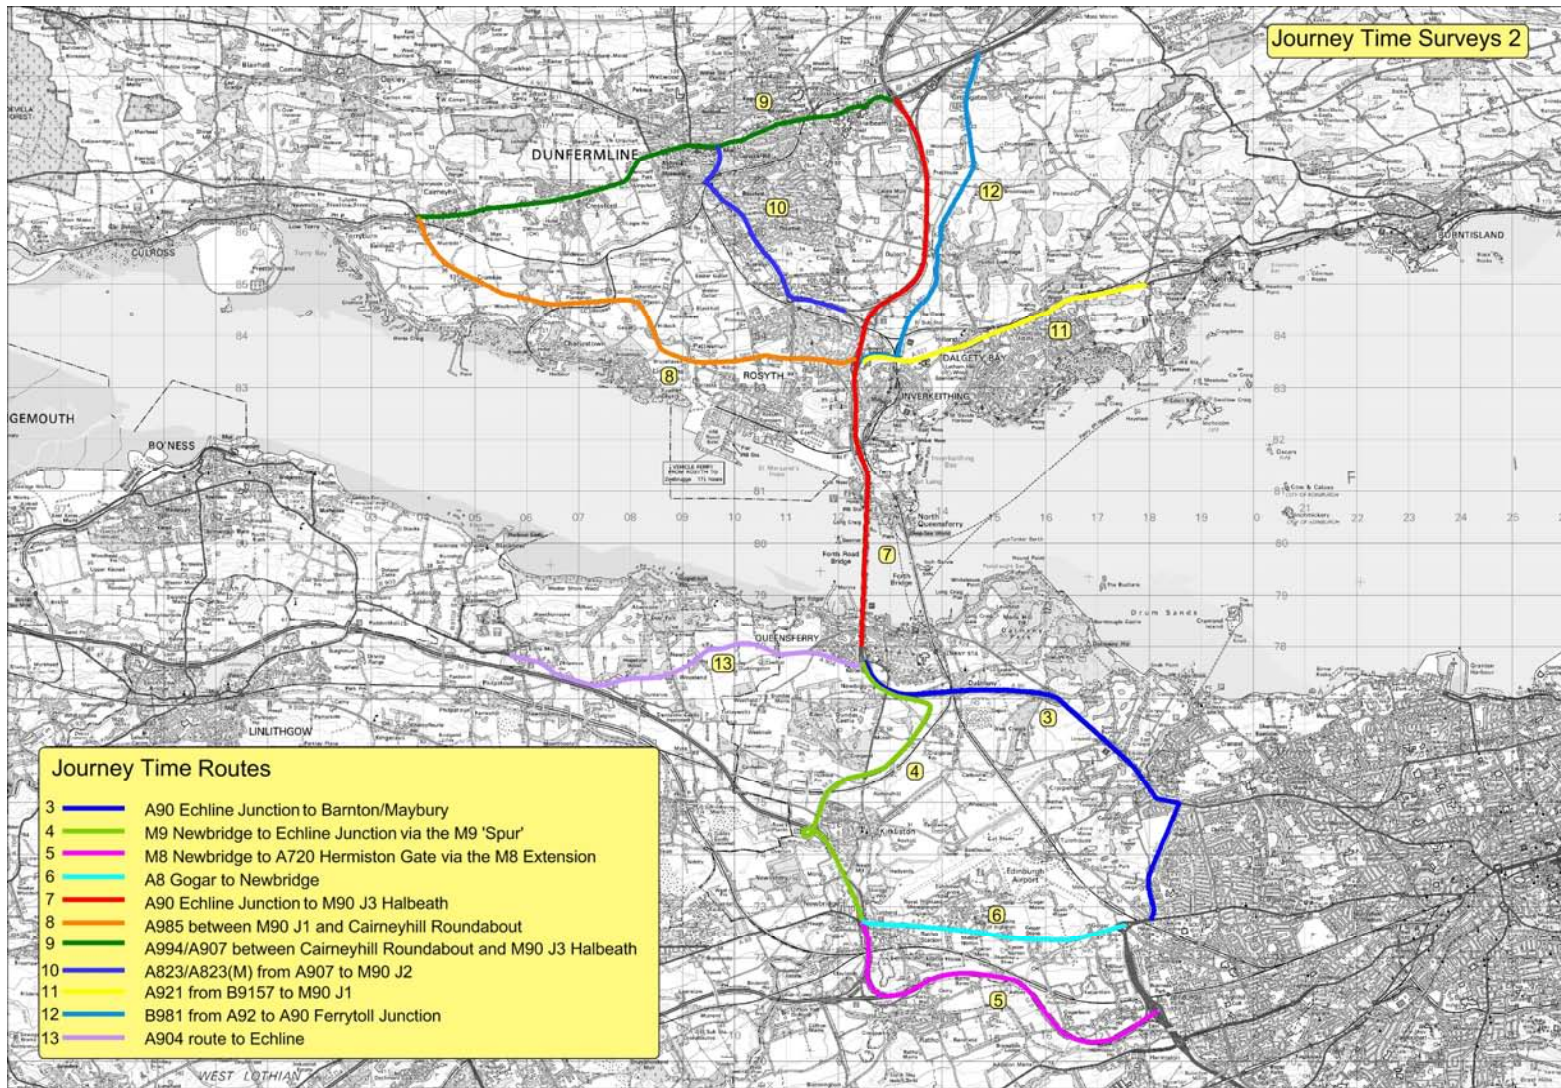

Figure 7-2 Local Journey Time Routes

Each local route was surveyed at least once per month in each direction for each of the following time periods:

- AM (07:00 – 09:00); and
- PM (16:00 – 18:00)

The surveys were undertaken on a Tuesday, Wednesday or Thursday to capture typical weekday journey times. The monitoring team ensured that during each month the surveys were spread across each of these weekdays to provide a representative and robust survey sample.

The following items were presented for each route based on the journey time surveys in the monthly monitoring summary tables:

- Number of runs undertaken each month in each direction;
- Average distance of route for each month; and
- Average journey time for each month.

Figure 7-4 Route 1 A90 M9 Junction 6 to M90 Halbeath Junction via Kincardine Bridge AM Peak

The journey time for route 1 has increased by approximately five minutes in both directions in the AM Peak, in the 12 month period from September 2011. The journey times recorded vary between 32 minutes and 36 minutes. This variation indicates that a consistent journey time along this route is difficult to achieve. Journey time route 9 covers the northern section of this route between the A944/A985 roundabout and Halbeath junction. From Table 7-17 it is evident that there is up to five minutes variation in the northbound journey time and three minutes in the southbound journey time on route 9. This demonstrates the variability in journey time over a section of route 1, which could be due to traffic signals and congestion within Dunfermline and surrounding settlements.

In addition, a number of HGVs use the A985 between the A985/A944 Roundabout and the Kincardine Bridge. As this is a single carriageway rural road, it can be difficult to overtake, causing platooning. In 2012, there were also road works on the M9 causing slow moving traffic on the southern section of the route. Congestion was also experienced around the Kincardine Bridge area. The combination of these factors probably resulted in slower journey times being recorded in 2012.

Figure 7-5 Route 1 A90 M9 Junction 6 to M90 Halbeath Junction via Kincardine Bridge PM Peak

The journey time for route 1 has increased by approximately five minutes in the southbound direction during the PM Peak. The journey times recorded vary between 32 minutes and 36 minutes. Similar issues were experienced during the PM Peak as the AM Peak. The northbound journey time is very similar for 2011 and 2012.

7.3 Route 2 M9 Junction 6 to M90 Halbeath Junction via FRC / FRB

Figure 7-7 Route 2 M9 Junction 6 to M90 Halbeath Junction via FRC / FRB AM Peak

The journey time for route 2 has increased by approximately five minutes in the northbound direction and eight minutes in the southbound direction during the AM Peak. Traffic management was installed on the M9 around Junction 1a, on the M9 Spur and on the M90 to the north of the FRB after the 2011 survey and was still in place during the 2012 survey. The traffic management has a 40 mph speed limit, enforced by average speed cameras which increase the journey time on this section. In addition to the reduced speed limit, the traffic management can result in additional congestion, particularly during the peak hours when these journey times were recorded.

Figure 7-8 Route 2 M9 Junction 6 to M90 Halbeath Junction via FRC / FRB PM Peak

The journey time for route 2 has increased by approximately twelve minutes in the northbound direction and five minutes in the southbound direction during the PM Peak. As in the AM Peak, the traffic management will have had an effect on the speed of vehicles travelling on this route, resulting in increased journey times.

Figure 7-10 Route 3 A90 Echline Junction to Maybury Junction AM Peak

The journey time route 3 is consistent throughout the year in the northbound direction during the AM Peak, with all of the journey times recorded being within seven to 11 minutes, with the exception of June, August and September 2012. The reasons for these increases are unclear, however it has been noted that traffic was heavier than usual with queuing experienced at Barnton Junction.

Route 3 is particularly busy in the southbound direction during the AM Peak. The journey time peaks at 31 minutes in November 2011, with the shortest time being 14 minutes in July 2011. The journey time for this route is generally somewhere around 20 to 25 minutes. The congestion is generally caused by the volumes of traffic that are entering a congested urban network. Route 3, travels through Barnton Junction and Maybury Junction, which are both controlled by traffic signals, and can have extensive queuing in the AM Peak. The shortest journey time was recorded in July 2012, and was a result of the survey being undertaken at 0830 hrs, when traffic has started to dissipate.

Table 7-6 Route 3 A90 Echline Junction to Maybury Junction PM Peak

	Sep-12	1	8.8	00:13:08	1	9.0	00:09:04

Figure 7-11 Route 3 A90 Echline Junction to Maybury Junction PM Peak

The PM Peak journey times are relatively consistent in both directions throughout the year, with a few outliers. July and August 2012 are particularly high in the northbound direction. This is due to extensive queuing on the A90 on the approach to the merge with the M9 Spur. The increase in the southbound journey times in November and February 2012 are due to congestion at Barnton Junction, with queuing being experienced on approach to the traffic signals.

	Sep-12	2	7.5	00:07:14	4	6.9	00:17:56

Figure 7-13 Route 4 M9 Newbridge Junction to Echline Junction via the M9 Spur AM Peak

Traffic management was implemented on the M9 Spur in November 2011, with a 40 mph speed limit, enforced by average speed cameras. The journey time in the northbound direction remained relatively consistent throughout the year in the AM Peak, as the traffic flow is lighter travelling northbound during this time period. The southbound journey times are more impacted by the levels of congestion. The December 2011 survey was particularly quick as it was undertaken after 0900 hrs which is outwith the congested period.

Table 7-8 Route 4 M9 Newbridge Junction to Echline Junction via the M9 Spur PM Peak

	Sep-12	3	7.5	00:11:04	3	6.9	00:07:19

Figure 7-14 Route 4 M9 Newbridge Junction to Echline Junction via the M9 Spur PM Peak

In the PM Peak the opposite occurs with the southbound journey time being more consistent than the northbound. As the major movement in this peak is traffic travelling away from Edinburgh, northbound over the FRB, congestion and queuing occurs on the northbound carriageway of the M9 Spur. As with the AM Peak this varies from day to day, resulting in a variable journey time.

7.6 Route 5 Newbridge Junction to the A720 Hermiston Gait via the M9/M8

Figure 7-15 5 Newbridge Junction to the A720 Hermiston Gait via the M9/M8

Figure 7-16 Route 5 Newbridge Junction to the A720 Hermiston Gait via the M9/M8 AM Peak

In the AM Peak, the journey time for route 5 westbound is consistent throughout the year. Traffic on the M8 between Hermiston Gait and Junction 2 is relatively light, resulting in no congestion and free flowing traffic, and a journey time of around five minutes every month. The eastbound journey time is more unreliable, with heavy congestion on the M8 between Junction 2 and Hermiston Gait. This has resulted in an approximate ten minute variation in journey time. This congestion is unpredictable, can occur at various times throughout the peak and varies in severity.

Table 7-10 Route 5 Newbridge Junction to the A720 Hermiston Gait via the M9/M8 PM Peak

Route Description	Date	Eastbound			Westbound		
		No. of Runs	Ave. Distance	Ave. Time	No. of Runs	Ave. Distance	Ave. Time

Sep-12	1	7.1	00:06:21	1	7.3	00:09:12	

Figure 7-17 Route 5 Newbridge Junction to the A720 Hermiston Gait via the M9/M8 PM Peak

The situation is reversed in the PM Peak with the eastbound journey time more consistent than the westbound. This is due to heavy congestion while leaving Edinburgh in the PM Peak. The variation in the westbound journey time is approximately five minutes, with delays due to the traffic management on the M9 making the journey time more variable. The eastbound journey time is more consistent, with some congestion experienced on the M8.

7.7 Route 6 A8 Gogar Junction to Newbridge Junction

Figure 7-18 Route 6 A8 Gogar Junction to Newbridge Junction

Table 7-11 Route 6 A8 Gogar Junction to Newbridge Junction AM Peak

Route Description	Date	Eastbound			Westbound

Sep-12	1	4.6	00:03:36	1	4.5	00:04:11	

Figure 7-19 Route 6 A8 Gogar Junction to Newbridge Junction AM Peak

The variation in journey time on route 6 in either direction during the AM Peak is approximately one and a half minutes. There were road works at Gogar roundabout that can result in some congestion when travelling eastbound, however this does not have a significant effect on journey time reliability as they are situated at the eastern extent of the route.

Table 7-12 Route 6 A8 Gogar Junction to Newbridge Junction PM Peak

Sep-12	1	4.6	00:03:58	1	4.5	00:07:29	

Figure 7-20 Route 6 A8 Gogar Junction to Newbridge Junction PM Peak

The westbound journey time is more variable than the eastbound in the PM Peak, with a large increase in April and a moderate increase in August. Delays at Newbridge Junction can cause queuing on this route, and result in a large variation in journey time. The April 2012 journey time is approximately 30 minutes longer than the average journey time of approximately ten minutes, with queuing traffic along the full length of the route. The increase in journey time in August 2012 was a result of queuing traffic between the junction at the Airport and Newbridge Roundabout. The reason for this queuing traffic is unclear, however it may be a result of queuing traffic from the traffic management on the M9 northbound, leading to congestion on Newbridge Roundabout.

7.8 Route 7 A90 Echline Junction to the M90 Halbeath Junction

Figure 7-22 Route 7 A90 Echline Junction to the M90 Halbeath Junction AM Peak

The southbound journey time for route 7 was extremely variable for the first six months of the surveys, with heavy congestion on approach to the FRB. Queuing started as far north as Masterton Junction in February, however the level of queue varied on a month by month basis, depending on the time the survey was undertaken. Since the traffic management was introduced, the journey time has become more consistent, with the 40 mph speed limit enforced using average speed cameras allowing traffic to flow more freely on approach to the FRB, however some congestion is experienced between Masterton Junction and the FRB. The northbound journey time has remained consistent throughout the year in the AM Peak. The introduction of the traffic management has had little effect on the northbound journey time.

Table 7-14 Route 7 A90 Echline Junction to the M90 Halbeath Junction PM Peak

Figure 7-23 Route 7 A90 Echline Junction to the M90 Halbeath Junction PM Peak

The route 7 PM Peak journey times are relatively consistent throughout the year, with a large increase in October 2011. This was due to a reduced speed limit that was in place due to road works. There was also congestion on the northbound carriageway of the FRB. The southbound journey time is generally recorded at around ten minutes for the majority of the surveys, however this drops to eight minutes in September 2011, and nine minutes from July to August 2012. The southbound route is generally free flowing for the duration of the route.

Figure 7-25 Route 8 A985 between A90 Admiralty Junction and Cairneyhill Roundabout AM Peak

Journey times on route 8 are generally consistent in both directions throughout the year. Localised congestion can be experienced due to the urban nature of sections of the route. There was a large increase in the eastbound journey time in September 2012 which was due to an accident on the A985. There was also an increase in the westbound journey time in February and August of 2012. The increase in February is a result of congestion around junctions within Rosyth, whilst the August 2012 journey time was delayed by the survey vehicle travelling behind a tractor for the duration of the route.

Table 7-16 Route 8 A985 between A90 Admiralty Junction and Cairneyhill Roundabout PM Peak

Route Description	Date	Eastbound			Westbound		
		No. of Runs	Ave. Distance	Ave. Time	No. of Runs	Ave. Distance	Ave. Time

Sep-12	1	9.5	00:09:26	1	9.6	00:10:01	

Figure 7-26 Route 8 A985 between A90 Admiralty Junction and Cairneyhill Roundabout PM Peak

During the PM Peak, the westbound journey times are again generally consistent throughout the year, however the eastbound journey times are more erratic. This is due to congestion within Rosyth on approach to Admiralty Junction.

Figure 7-28 Route 9 A994 / A907 between Cairneyhill Roundabout and M90 Halbeath Junction AM Peak

As journey time route 9 travels through Dunfermline town centre, as well as a number of villages on the outskirts of Dunfermline, congestion and queuing at junctions can be experienced. This is reflected in the variability in the journey time surveys, particularly in the eastbound direction in the AM Peak. There are also a number of signalised junctions within Dunfermline which can result in some additional delay. The junction layout at the A907/A823 junction has been changed since the surveys began, with road works in place here for the majority of the year. These road works will also have had an effect on the varying levels of congestion.

Table 7-18 Route 9 A994 / A907 between Cairneyhill Roundabout and M90 Halbeath Junction PM Peak

Figure 7-31 Route 10 A823 (M) between the A907 and M90 Masterton Junction AM Peak

Similar to route 9, route 10 travels through a congested urban network, with a number of signalised junctions and roundabouts. This can result in a variation in journey times. In general all of the journey time surveys reported the traffic level to be free flowing with some congestion at the roundabout at the railway station and the A823 (M). This congestion and the traffic signals may be the cause of the journey time variation.

Table 7-20 Route 10 A823 (M) between the A907 and M90 Masterton Junction PM Peak

Route Description	Date	Northbound			Southbound		
		No. of Runs	Ave. Distance	Ave. Time	No. of Runs	Ave. Distance	Ave. Time

Figure 7-32 Route 10 A823 (M) between the A907 and M90 Masterton Junction PM Peak

Similar to the AM Peak, variations in journey time due to the junctions and traffic signals are experienced. In May 2012 some queuing was experienced on the A823 (M) where traffic management reduced the carriageway from two lanes to one, however in general the route was free flowing outwith the congestion at the roundabout and traffic signals. The increase in the southbound journey time in March 2012 was due to the survey vehicle being behind a hesitant driver at the railway station roundabout. This added approximately one minute to the journey time.

Figure 7-34 Route 11 A921 between the B9157 and A90 Admiralty Junction AM Peak

Journey time route 11 is generally free flowing with the exception of the approach to the double roundabout at the A921/A981 junction. Congestion is experienced in both directions at this junction. This results in journey time variability as the level of congestion is not consistent from one day to the next. There is also congestion on the westbound approach to Admiralty Junction in the AM Peak.

Figure 7-37 Route 12 B981 between A92 and A90 Admiralty Junction AM Peak

Journey time route 12 has the same issue as journey time route 11, as it passes through the same section of the A921 between Admiralty Junction and the B981. In addition to this, there is congestion within Crossgates to the north of route 12, resulting in further variation in journey time. The increased southbound journey time in April 2012 was a result of queuing traffic approaching the double roundabout at the B981/A921 junction.

Figure 7-38 Route 12 B981 between A92 and A90 Admiralty Junction PM Peak

The same issues arise in the PM Peak with congestion experienced around Admiralty Junction, the double roundabout at the A921/B981 junction and within Crossgates itself. The increased northbound journey time in April 2012 was a result of queuing traffic entering Crossgates due to traffic calming on the approach to the village.

Figure 7-40 Route 13 A904 Old Philpstoun to Echline Junction AM Peak

Journey time surveys along route 13 have been generally consistent during the AM Peak, with some slight increases from January 2012 onwards. The speed limit on the A904 to the west of Echline Junction has been reduced from 40 mph to 30 mph resulting in a slightly slower journey time. Congestion can also be encountered around Echline Junction which has resulted in some journey time variation.

Sep-12	1	7.0	00:06:48	1	7.0	00:06:53	

Figure 7-41 Route 13 A904 Old Philpstoun to Echline Junction PM Peak

The journey times are generally consistent in both directions during the PM Peak with the exception of April and July 2012, when the eastbound journey times increased to approximately 11 minutes and 13 minutes respectively. These increases were due to congestion approaching Echline junction. The reason for the delay at the roundabout is unclear but could be a result of queuing on approach to the FRB backing up onto the junction.
