1.1 Data Tables

- 1.1.1 The tables in this section present the detailed assumptions and noise calculation information for the construction noise assessment.
- 1.1.2 Acoustic 'On-Times' have been derived based upon experience, given the definition of the term contained in BS5228-1:2009+A1:2014. The acoustic on-time is the period of time that the equipment is working at full power, or within 3dB of its maximum.

- 1.1.3 It is assumed that there will not be any particular screening between construction activities and receptors. The ground cover has been assumed to be acoustically soft.
- 1.1.4 The times of operation of the construction works themselves; a typical 12-hour working day is assumed (0700-1900) during the week. It is assumed that construction activities will take place for 10 hours, allowing for breaks.
- 1.1.5 Table 2 presents the distances assumed for receptors from different phases of work. Where an activity will be undertaken in excess of 350m from works, the construction phase is not assessed. The exception is for Dalwhinnie where calculations are presented for works on the A9 at approximately 400m and the results are presented for information.

Receptors Location		Distance to Receptor (m) in Construction Phase(s)								
		1&4	2&3	5-7	8	9&10	11-14	15-18

4	Crubenmore	230	-	230	-	230	235	-		
5	Truim Cottage	95	-	95	-	95	100	-		
* 1A is for works associated with the location of the tie-in, 1B is for works located at the junction and A9 itself.
